| <b>14. ABSTRACT</b><br><p>The evaporation of sulfur mustard from sand was studied as a function of temperature, drop size and air flow rate, using the same instrumentation as prior studies on glass. The evaporation rate increased with higher temperature, drop size, and wind speed; and an empirical equation was determined that would allow for the calculation of the evaporation rate given the environmental conditions.</p>  |                                       |   |   |  |                |             |             |           |           |               |

## EVAPORATION RATES OF CHEMICAL WARFARE AGENTS

### MEASURED USING 5 CM WIND TUNNELS

#### II. MUNITIONS GRADE SULFUR MUSTARD FROM SAND

#### 1. INTRODUCTION

The evaporation rate of the vesicant chemical warfare agent sulfur mustard [bis(2-chloroethyl)sulfide, (ClCH<sub>2</sub>CH<sub>2</sub>)<sub>2</sub>S] from glass has been previously determined. In this work, the evaporation of 77% pure munitions grade sulfur mustard (abbreviated H) from three types of sand was determined, in comparison to the evaporation of 97% pure Chemical Agent Standard Analytical Reference Material grade sulfur mustard (abbreviated HD) from glass.

The 5 cm laboratory-sized wind tunnels<sup>1</sup> and the wind tunnel characteristics<sup>2</sup> compared to other wind tunnels and outdoor measurements have been published.<sup>2,3</sup> The vapors of sulfur mustard were quantitatively collected using thermal desorption tubes. This report describes how the data were analyzed and demonstrates the robustness of the set of data that will be passed to the modelers for eventual incorporation into the software program VLSTRACK, which predicts the vapor hazard of chemical agents under various environmental conditions.

#### 2. EXPERIMENTAL PROCEDURES

##### 2.1 Wind Tunnel.

The 5 cm wind tunnels that were used in these experiments have been previously described, and were the same as those used for the studies on glass.<sup>4,5</sup> In order to expose the agent to the wind flow, the piston was removed, and the test substrate (sand in a cup that had a 240 mm diameter and 15 mm depth) with the droplet of agent on it was placed on the piston and inserted into the wind tunnel. The humidified, temperature-controlled air from a Miller-Nelson Environmental Control Unit (tunnel a) or Aalborg MFC (tunnels c, d, k, l) was then passed over the sample, and the vapors were collected on thermal desorption tubes at the vapor sampling inlet. The amount of agent on each tube was measured based upon a standard in the Gas Chromatography/Mass Spectrometry (GC/MS). The sample volume and tunnel air flow rate were known; thus, the agent concentration (mg/m<sup>3</sup>) and evaporation rate (µg/min) could be calculated. The rates were not calculated for the initial 3 min of the experiment, before the instrumentation had reached equilibrium, nor at the end of the experiment, when the concentration of mustard was nearing a plateau. Hence, the middle of the concentration data was used to calculate the evaporation rates. The points for the rate were chosen such that  $r^2 > 0.99$ .

Air flows were 18, 181 and 405 standard liters per minute (SLPM), which corresponded to velocity values at a 1 cm height of 0.22, 1.7 and 3.6 m/s. The flow volume per thermal desorption tube was typically 2 to 10 L volume, and the tubes were automatically switched using a proprietary Versatile Tube Sampler. The rate at which the tubes were switched was adjusted based upon the evaporation rate of the agent. The air and substrate temperatures

were 15, 35, and 50 °C, and the droplet sizes were 1, 6, and 9 µL, corresponding to contamination densities of approximately 1.3, 7, and 11 g/m<sup>2</sup>.

## 2.2 Agent.

Sulfur mustard, [bis(2-chloroethyl) sulfide, (ClCH<sub>2</sub>CH<sub>2</sub>)<sub>2</sub>S], is commonly abbreviated H for munitions grade and HD for distilled. Impurities seen in the GC/MS that are commonly present in munitions grade mustard are Q [sesquimustard, bis(2-chloroethylthio) ethane, (ClCH<sub>2</sub>CH<sub>2</sub>SCH<sub>2</sub>)<sub>2</sub>, 10.1%] the cyclic ether 1,4-dithiane, [S(CH<sub>2</sub>CH<sub>2</sub>)<sub>2</sub>S, 3.2%], 1,2-dichloroethane (2.6%) and 4-chlorobutyl 2-chloroethyl sulfide (1.0%), and 16 other analytes (totaling 3.9%). **Caution: sulfur mustard is a potent vesicant and care must be taken to prevent exposure to liquid or vapor. It should only be manipulated by trained personnel employing appropriate engineering controls and personal protective equipment.**

## 2.3 GC/MS Detection.

### 2.3.1 Vapors Generated in Wind Tunnel.

This protocol was the same as used for the studies of the evaporation of HD from glass. Gas Chromatography/Mass Spectrometric Detector (GC/MSD) analysis of the thermal desorption tubes was performed on a Markes UNITY/ULTRA Thermal Desorption system connected to an Agilent Technologies 6890N GC/5973 MSD equipped with a HP-5MS [30 m long, 0.25 mm i.d., 0.25 µm film thickness, (5%-phenyl)-methylpolysiloxane stationary phase] capillary column (Agilent Technologies, Wilmington, DE). The thermal desorption tubes used were Markes Tenax thermal desorption tubes (Markes International, Llantrisant, UK, Part #C0102S). Each sample was prepurged for 1 min then desorbed for 2.5 min at 250 °C. The transfer line to the GC was heated to 180 °C. The GC oven temperature profile was ramped from 75 °C for 2 min to 110 °C at 20/min, to 290 °C at 80 °C/min. The column flow rate at 75 °C was 1.6 mL/min (46 cm/s) at a constant pressure of 15 psi. The injection temperature was 250 °C; MSD transfer line 180 °C; MSD quad 150 °C; and MSD source at 230 °C. The sample extracts were analyzed in the electron impact (EI) mode scanning from 30 – 300 amu, with 2.78 scans/s. Under these conditions, HD eluted at ~2 min. Both sulfur mustard and a breakdown ion were seen in the mass spectrum.

### 2.3.2 Analysis of Liquid Extracts.

Gas Chromatography/Mass Spectrometric Detector analysis of the organic liquid extracts was performed on an Agilent Technologies 6890N GC/5973 MSD equipped with a 30 m X 0.25mm HP-5 capillary column (Agilent Technologies, Wilmington, DE). The oven temperature profile was ramped from 45 °C for 5 min to 265 °C at 10 °C/min. The injection temperature was 250 °C; MSD transfer line 280 °C; MSD quad 150 °C; and MSD source at 230 °C. The sample extracts were analyzed in the electron impact (EI) mode scanning from 40 – 350 amu. One microliter was injected on a split/splitless inlet with a purge time 0.5 min; purge flow rate 25 mL/min; with a constant helium column flow rate of 1 mL/min (average linear velocity of 36 cm/s). Gas Chromatography/Mass Spectrometry of the extracts detected

1,4-oxathianc, 2-hydroxyethyl vinyl sulfide (HOEVS), 2-chloroethyl vinyl sulfide (CEVS), and thiodiglycol (TDG).

## 2.4

### Substrates.

The UK sand used was AFS-50 Fine Sand produced by Warmwell Quarry in the United Kingdom. The physical properties from the specifications sheet of the supplier indicate a predominant particle size of 0.25 to 0.5 mm; 98.6% SiO<sub>2</sub>, 0.39% aluminum oxide and 0.09% ferric oxide, and a skeletal density of 2.65 g/cm<sup>3</sup>. The sand had a surface area of 0.23 m<sup>2</sup>/g, of which 0.0382 m<sup>2</sup>/g were micropores\* and the pH of 0.1 g sand in 2 mL water, measured after 24 hr using pH paper, was 6. The measured bulk and tapped densities of the sand were 1.34, and 1.48 g/cm<sup>3</sup>, respectively, yielding void volumes of 50 and 44%, respectively. The sand was used at ambient conditions; oven drying indicated that ~2% water had adsorbed to the sand. Chemical analyses are in Appendix C, and surface area data are given in Appendix D.

The southwest sand was obtained from the back gate of Cannon AFB, New Mexico, and is a surface sample. Chemical analyses are in Appendix E, and surface area data are given in Appendix F.

The Saudi sand was obtained from the Torrispamments Plains, Dhahran Royal Saudi Air Base, and was comprised of 86% sand, 10% silt, and 4% clay, with a pH of 7.85.<sup>6</sup> Surface area data are given in Appendix G.

## 2.5

### Experimental Design and Data Analysis.

The experimental design was generated and the data were analyzed using JMP® Statistical Discovery Software. There were three variables: temperature, drop size, and air flow rate at three levels each. Measuring all combinations of these levels would yield 27 conditions (3 x 3 x 3); the cubic composite design chosen required 9 conditions, which can be described as the vertiees of a cube and the body mid-point. The data were collected in triplicate as two blocks of four vertices (chosen as the corners of a tetrahedron) and the mid-point. This collection of data would allow for the determination of the major contributing variables and cross-variables. The substrate temperature (°C), droplet mass (mg, based on HD only, already adjusted for impurities), air flow (SLPM), total percent sulfur mustard recovered from the vapor and tunnel identity (four similar 5 cm tunnels were available) were controlled as variables that may affect the raw evaporation rate. Cross factors between droplet mass, air flow and temperature were included in the initial numerical analysis. Factors that were determined not to be significant were deleted and the regression was re-calculated.

---

\* Surface areas were from 5 point BET measurements, and the micropore area was from an adsorption t-plot, using nitrogen gas, collected by Micromeritics Inc., Norcross, GA.

### 3. RESULTS

#### 3.1 Evaporation Rate.

A plot of H concentration versus time is shown in Figure 1; in this experiment a simultaneous measurement of H in the air was measured using a Hyfed. The Hyfed curve reached a plateau before the concentrations did, thus indicating the relative sensitivity of the two techniques. The concentrations were converted to mg H and plotted in Figure 2. The raw evaporation rate was calculated from the first set of points for 0 to 77 min; the  $r^2$  was 0.99. For all samples, the evaporation rate was calculated from the first 5 to 20 points that had an  $r^2$  of 0.99. For H evaporation from sand, the evaporation rate slowed with time; only the initial rate was calculated in this work. A more thorough analysis and interpretation of the evaporation curve will occur separately.<sup>7</sup> The %vapor recovered and raw evaporation rates are shown in cube plots (Figures 3 and 4); temperature, drop size and SLPM affected the evaporation rate, but no factors obviously affected the %vapor recovered.

The average %vapor recovered was 75%, (Figure 5a, Table 1) in comparison to HD on glass, for which the value was 86%. The %vapor collected was based upon the %sulfur mustard that was deposited after accounting for the purity of the munitions H. After the end of the reaction, the sand was extracted and analyzed for remaining sulfur mustard for 35 of the samples; the average %mass extracted was 8.6% (Figure 5b), these samples yielded a vapor and mass sum of 88% recovery (Figure 5c, Table 1).

The effect of only temperature on the evaporation rate is shown in Figure 6. The combined effects of temperature, drop size, air flow (SLPM), %relative humidity (RH), and %vapor recovered on the evaporation rate were calculated using a least squares method. Significant factors were identified as those with Prob > |t| of 0.05 or less. Analogously to the studies on glass, a straight-line regression was obtained for the  $\log_{10}$ (evaporation rate) (Figure 7, Table 2,  $r^2 = 0.93$ ,  $n = 63$ , eq 1), compared to the curvature observed for the evaporation rate ( $r^2 = 0.71$ ). The %vapor recovered was random, and did not show any statistically relevant trend with drop size, air flow, or temperature.

#### UK Sand only

$$\begin{aligned} \log_{10}(\text{evaporation rate}) = & -0.41 + (0.025 * \text{Temp}) + (0.050 * \text{Drop Size}) \\ & + (0.0007 * \text{SLPM}) + (0.004 * \% \text{Vapor Recovered}) \end{aligned} \quad (1)$$

Since only eight wind tunnel experiments were performed with the Saudi sand, the least squares analysis was repeated by combining the Saudi data with the UK sand. For the evaporation rates, the same regression,  $r^2 = 0.93$  was obtained for the least squares fit, the parameter estimates showed that the sand type was not a significant factor contributing to the evaporation rate (Figure 8, Table 2), and an equation that best fit the data was generated (eq 2).

#### UK and Saudi Sand

$$\begin{aligned} \log_{10}(\text{evaporation rate}) = & -0.436 + (0.026 * \text{Temp}) + (0.051 * \text{Drop Size}) \\ & + (0.0007 * \text{SLPM}) + (0.0036 * \% \text{Vapor Recovered}) \end{aligned} \quad (2)$$

As only 4 southwest sand samples were available, eq 1 was used to predict the rate for the southwest (and Saudi) sands, and a plot of raw evaporation rate versus predicted evaporation rate was made (Figure 9). The southwest and Saudi sands fall on the same line, thus implying that there is little difference in evaporation rates between them.

## 3.2

Surface Area.

Video cameras were used to measure the surface area of the mustard droplets (Figures 10 and 11) and the time that each droplet took to reach the maximum surface area. The surface area of the droplet increased over time up to 800 min. The maximum surface area as a function of temperature, drop size, and flow rate is plotted in Figure 12. The larger droplets gave a greater spread than the smaller ones, as would be expected. The least squares analysis of the surface area on only the UK sand as a function of wind speed, temperature, and drop size had  $r^2 = 0.94$  ( $r^2_{adj} = 0.93$ ,  $n = 49$ , Figure 13, eq 3, Table 3); addition of the Saudi sand data lowered the  $r^2$  to 0.89 ( $r^2_{adj} = 0.88$ ,  $n = 55$ , eq 4, Table 3). Tunnel effects were not included, and %RH was not a significant factor.

$$\text{Surface Area, UK only, no tunnel effect} \quad (3)$$

$$32.33 + (-0.574 * \text{temp}) + (4.98 * \text{drop size}) + (-0.022 * \text{SLPM}) + (0.128 * \% \text{vapor recovered})$$

$$\text{Surface Area, UK & Saudi} \quad (4)$$

$$13.62 + (-0.678 * \text{temp}) + (5.49 * \text{drop size}) + (-0.036 * \text{SLPM}) + (0.293 * \% \text{RH}) + (0.381 * \% \text{vapor recovered})$$

The time to reach the maximum area as a function of temperature, drop size, and flow rate for the combined UK and Saudi sands is summarized in Figure 14. The times were highly variable, by as much as a factor of ten. The least squares analysis of the spread time as a function of wind speed, temperature and drop size had a low  $r^2 = 0.50$  ( $r^2_{adj} = 0.43$ ,  $n = 49$ ). Due to the curvature in the plot the logarithm was used; this also gave a low  $r^2 = 0.53$  ( $r^2_{adj} = 0.463$ ,  $n = 49$ ). Not surprisingly, few significant factors were found (Table 4). An  $r^2$  of 0.5 means that 50% of the source of the variance between the samples was not explained by the factors chosen; the underlying causes for the variation in the time taken to reach the maximum surface area are not well understood.

#### 4. DISCUSSION

The evaporation rates given for the sand were the initial evaporation rates. The evaporation curves changed shape with time; methods to fit these curves and interpret the evaporation rate as a function of basic physical parameters, such as viscosity, porosity, and vapor pressures are being developed by Navaz et al.,<sup>8</sup> who have published interpretations for HD evaporation from glass. This work shows that the basic assumptions about which factors contribute to the evaporation rate (drop size, temperature, and air flow) were valid.

The reason for the high variability in the time taken to reach the maximum spread area on sand is not known.

## 5. CONCLUSIONS

The data collected indicated that the evaporation profiles of sulfur mustard from UK, SW, and Saudi sands were similar despite the fact that the three sands have different compositions and grain sizes. The generation of a least squares fit curve for the sand samples allows for a facile comparison of the evaporation rate of sulfur mustard from any other sand encountered to the UK sand.

**Graph Legend:**

- ◆ Thermal Tubes
- ▲ Agent Remaining (%)

**Graph Axis Labels:**

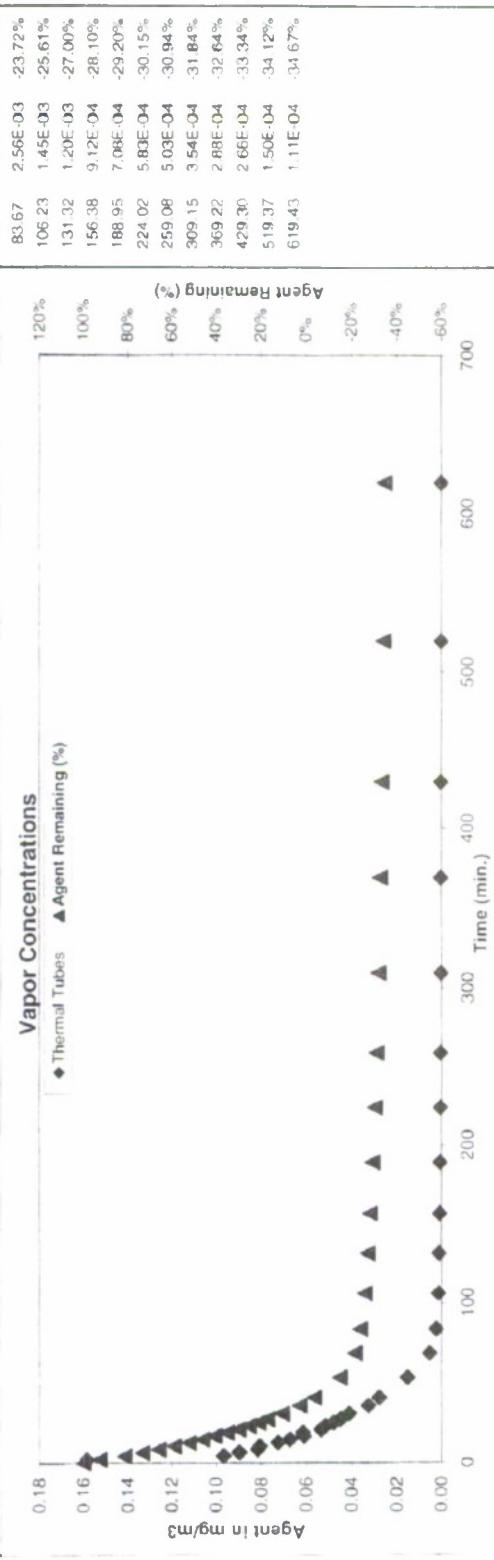

- Y-axis: Agent in mg/m³
- X-axis: Time (min.)

**Graph Title:** Vapor Concentrations

**Graph Description:** This graph illustrates the relationship between time and vapor concentration for two different extraction methods. The 'Agent Remaining (%)' series (triangles) shows a steeper increase in concentration over time compared to the 'Thermal Tubes' series (diamonds), indicating more rapid extraction or volatilization of the agent.

**Surface Area Reports**

ASAP 2420 V2.02 J

Unit 2 Port 5

Serial #: 106

Page 12

Sample: SandUK C7  
Operator: AT  
Submitter: SAIC  
File: C:\2420\2007\10OCT\07-4317.SMP

Started: 10/26/2007 3:36:45PM      Analysis Adsorptive: N2  
Completed: 10/27/2007 2:12:52AM      Analysis Bath Temp.: 77.300 K  
Report Time: 10/30/2007 9:27:01AM      Thermal Correction: No  
Sample Mass: 0.5251 g      Warm Free Space: 28.4000 cm<sup>3</sup> Entered  
Cold Free Space: 87.6000 cm<sup>3</sup>      Equilibration Interval: 20 s  
Low Pressure Dose: 0.200 cm<sup>3</sup>/g STP      Automatic Degas: No

**Pore Size Table**

| Pore Width<br>(Å) | Cumulative<br>Volume<br>(cm <sup>3</sup> /g) | Incremental<br>Volume<br>(cm <sup>3</sup> /g) | Cumulative<br>Area<br>(m <sup>2</sup> /g) | Incremental<br>Area<br>(m <sup>2</sup> /g) |
|-------------------|--|---|---|--|
| 117.82            | 0.00006                                      | 0.00000                                       | 0.160                                     | 0.000                                      |

**Surface Area Reports**

ASAP 2420 V2.02 J

Unit 2 Port 6

Serial #: 106

Page 8

Sample: SandME A2  
Operator: AT  
Submitter: SAIC  
File: C:\2420\2007\10OCT\07-4318.SMP

Started: 10/26/2007 3:36:45PM  
Completed: 10/27/2007 2:12:52AM  
Report Time: 10/30/2007 9:27:03AM  
Sample Mass: 0.5005 g  
Cold Free Space: 85.5700 cm<sup>3</sup>  
Low Pressure Dose: 0.200 cm<sup>3</sup>/g STP

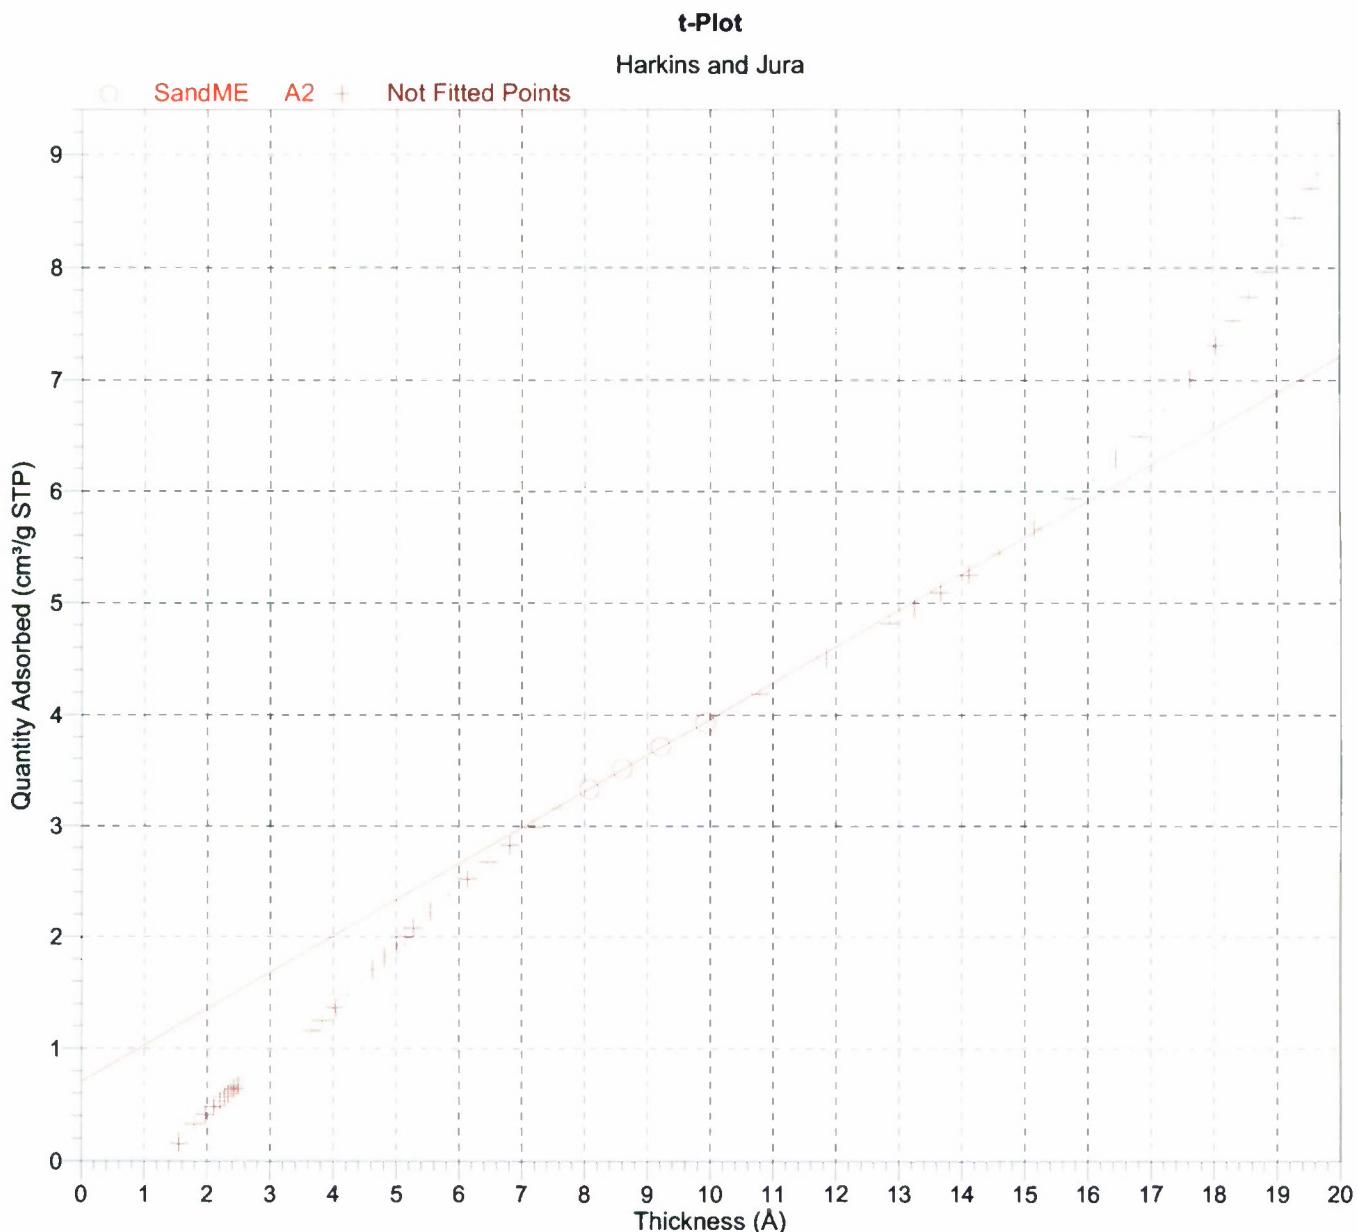

Analysis Adsorptive: N2  
Analysis Bath Temp.: 77.300 K  
Thermal Correction: No  
Warm Free Space: 27.7500 cm<sup>3</sup> Entered  
Equilibration Interval: 20 s  
Automatic Degas: No

## Surface Area Reports

ASAP 2420 V2.02 J

Unit 2 Port 6

Serial #: 106

Page 11

Sample: SandME A2  
 Operator: AT  
 Submitter: SAIC  
 File: C:\2420\2007\10OCT\07-4318.SMP

Started: 10/26/2007 3:36:45PM  
 Completed: 10/27/2007 2:12:52AM  
 Report Time: 10/30/2007 9:27:03AM  
 Sample Mass: 0.5005 g  
 Cold Free Space: 85.5700 cm<sup>3</sup>  
 Low Pressure Dose: 0.200 cm<sup>3</sup>/g STP

Analysis Adsorptive: N2  
 Analysis Bath Temp.: 77.300 K  
 Thermal Correction: No  
 Warm Free Space: 27.7500 cm<sup>3</sup> Entered  
 Equilibration Interval: 20 s  
 Automatic Degas: No

Pore Size Table

| Pore Width (Å) | Cumulative Volume (cm <sup>3</sup> /g) | Incremental Volume (cm <sup>3</sup> /g) | Cumulative Area (m <sup>2</sup> /g) | Incremental Area (m <sup>2</sup> /g) |
|----------------|--|---|-------------------------------------|--------------------------------------|
| 18.80          | 0.00031                                | 0.00000                                 | 0.818                               | 0.000                                |

### Surface Area Reports

ASAP 2420 V2.02 J

Unit 2 Port 6

Serial #: 106

Page 12

Sample: SandME A2  
 Operator: AT  
 Submitter: SAIC  
 File: C:\2420\2007\10OCT\07-4318.SMP

Started: 10/26/2007 3:36:45PM  
 Completed: 10/27/2007 2:12:52AM  
 Report Time: 10/30/2007 9:27:03AM  
 Sample Mass: 0.5005 g  
 Cold Free Space: 85.5700 cm<sup>3</sup>  
 Low Pressure Dose: 0.200 cm<sup>3</sup>/g STP

Analysis Adsorptive: N2  
 Analysis Bath Temp.: 77.300 K  
 Thermal Correction: No  
 Warm Free Space: 27.7500 cm<sup>3</sup> Entered  
 Equilibration Interval: 20 s  
 Automatic Degas: No

**Pore Size Table**

Sample: SandME A2  
 Operator: AT  
 Submitter: SAIC  
 File: C:\2420\2007\10OCT\07-4318.SMP

Started: 10/26/2007 3:36:45PM  
 Completed: 10/27/2007 2:12:52AM  
 Report Time: 10/30/2007 9:27:03AM  
 Sample Mass: 0.5005 g  
 Cold Free Space: 85.5700 cm<sup>3</sup>  
 Low Pressure Dose: 0.200 cm<sup>3</sup>/g STP

Analysis Adsorptive: N2  
 Analysis Bath Temp.: 77.300 K  
 Thermal Correction: No  
 Warm Free Space: 27.7500 cm<sup>3</sup> Entered  
 Equilibration Interval: 20 s  
 Automatic Degas: No

Isotherm Table

| Relative Pressure | Experimental Quantity Adsorbed (cm <sup>3</sup> /g STP) | Fitted Quantity Adsorbed (cm <sup>3</sup> /g STP) | Absolute Residual (cm <sup>3</sup> /g STP) | Relative Residual |           |

## Surface Area Reports

ASAP 2420 V2.02 J

Unit 2 Port 6

Serial #: 106

Page 16

Sample: SandME A2  
 Operator: AT  
 Submitter: SAIC  
 File: C:\2420\2007\10OCT\07-4318.SMP

Started: 10/26/2007 3:36:45PM  
 Completed: 10/27/2007 2:12:52AM  
 Report Time: 10/30/2007 9:27:03AM  
 Sample Mass: 0.5005 g  
 Cold Free Space: 85.5700 cm<sup>3</sup>  
 Low Pressure Dose: 0.200 cm<sup>3</sup>/g STP

Analysis Adsorptive: N2  
 Analysis Bath Temp.: 77.300 K  
 Thermal Correction: No  
 Warm Free Space: 27.7500 cm<sup>3</sup> Entered  
 Equilibration Interval: 20 s  
 Automatic Degas: No

Isotherm Table

| Relative Pressure | Experimental Quantity Adsorbed (cm <sup>3</sup> /g STP) | Fitted Quantity Adsorbed (cm <sup>3</sup> /g STP) | Absolute Residual (cm <sup>3</sup> /g STP) | Relative Residual |
|-------------------|---|---|--|-------------------|
| 0.946242100       | 5.9984  | 6.5157  | -0.5173                                    | -0.086239         |
